## NEW COMPOUNDS

### FIELD OF THE INVENTION

5 The present invention relates to novel compounds, and pharmaceutically acceptable salts thereof, which inhibit basic carboxypeptidases, more specifically carboxypeptidase U, and thus can be used in the prevention and treatment of diseases wherein inhibition of carboxypeptidase U is beneficial. In further aspects, the invention relates to compounds of the invention for use in therapy; to processes for preparation of such new compounds; to  
10 pharmaceutical compositions containing at least one compound of the invention, or a pharmaceutically acceptable salt thereof, as active ingredient; and to the use of the active compounds in the manufacture of medicaments for the medical use indicated above.

### BACKGROUND OF THE INVENTION

15 Fibrinolysis is the result of a series of enzymatic reactions resulting in the degradation of fibrin by plasmin. The activation of plasminogen is the central process in fibrinolysis. The cleavage of plasminogen to produce plasmin is accomplished by the plasminogen activators, tissue-type plasminogen activator (t-PA) or urokinase-type plasminogen  
20 activator (u-PA). Initial plasmin degradation of fibrin generates carboxy-terminal lysine residues that serves as high affinity binding sites for plasminogen. Since plasminogen bound to fibrin is much more readily activated to plasmin than free plasminogen this mechanism provides a positive feedback regulation of fibrinolysis.

25 One of the endogenous inhibitors to fibrinolysis is carboxypeptidase U (CPU). CPU is also known as plasma carboxypeptidase B, active thrombin activatable fibrinolysis inhibitor (TAFIa), carboxypeptidase R and inducible carboxypeptidase activity. CPU is formed during coagulation and fibrinolysis from its precursor proCPU by the action of proteolytic enzymes *e.g.* thrombin, thrombin-thrombomodulin complex or plasmin. CPU cleaves basic  
30 amino acids at the carboxy-terminal of fibrin fragments. The loss of carboxy-terminal lysines and thereby of lysine binding sites for plasminogen then serves to inhibit fibrinolysis.

By inhibiting the loss of lysine binding sites for plasminogen and thus increase the rate of plasmin formation, effective inhibitors of carboxypeptidase U would be expected to facilitate fibrinolysis.

5

2-mercaptomethyl-3-guanidinoethylthiopropionic acid is reported as a carboxypeptidase N inhibitor. More recently, this compound has been shown to inhibit CPU, Hendriks, D. *et al.*, Biochimica et Biophysica Acta, 1034 (1990) 86-92.

10

Guanidinoethylmercaptosuccinic acid is reported as a carboxypeptidase N inhibitor. More recently, this compound has been shown to inhibit CPU, Eaton, D. L., *et al.*, The Journal of Biological Chemistry, 266 (1991) 21833-21838.

5 solvates of the compounds of the present invention are within the scope of the invention.

#### *Pharmaceutical formulations*

In yet a further aspect, the invention relates to pharmaceutical compositions containing at  
10 least one compound of the present invention, or a pharmaceutically acceptable salt thereof, as active ingredient.

For clinical use, the compounds of the invention are formulated into pharmaceutical  
formulations for oral, intravenous, subcutaneous, tracheal, bronchial, intranasal,  
15 pulmonary, transdermal, buccal, rectal, parenteral or other mode of administration. The  
pharmaceutical formulation contains a compound of the invention in combination with one  
or more pharmaceutically acceptable ingredients. The carrier may be in the form of a solid,  
semi-solid or liquid diluent, or a capsule. These pharmaceutical preparations are a further  
object of the invention. Usually the amount of active compounds is between 0.1–95% by  
20 weight of the preparation.

In the preparation of pharmaceutical formulations containing a compound of the present  
invention the compound selected may be mixed with solid, powdered ingredients, such as  
lactose, saccharose, sorbitol, mannitol, starch, amylopectin, cellulose derivatives, gelatin,  
25 or another suitable ingredient, as well as with disintegrating agents and lubricating agents  
such as magnesium stearate, calcium stearate, sodium stearyl fumarate and polyethylene  
glycol waxes. The mixture may then be processed into granules or pressed into tablets.

Soft gelatine capsules may be prepared with capsules containing a mixture of the active  
30 compound or compounds of the invention, vegetable oil, fat, or other suitable vehicle for  
soft gelatine capsules. Hard gelatine capsules may contain granules of the active  
compound. Hard gelatine capsules may also contain the active compound in combination

with solid powdered ingredients such as lactose, saccharose, sorbitol, mannitol, potato starch, cornstarch, amylopectin, cellulose derivatives or gelatine.

Dosage units for rectal administration may be prepared (i) in the form of suppositories  
5 which contain the active substance mixed with a neutral fat base; (ii) in the form of a  
gelatine rectal capsule which contains the active substance in a mixture with a vegetable  
oil, paraffin oil or other suitable vehicle for gelatine rectal capsules; (iii) in the form of a  
ready-made micro enema; or (iv) in the form of a dry micro enema formulation to be  
reconstituted in a suitable solvent just prior to administration.

10

Liquid preparations may be prepared in the form of syrups or suspensions, e.g. solutions or  
suspensions containing the active ingredient and the remainder consisting, for example, of  
sugar or sugar alcohols and a mixture of ethanol, water, glycerol, propylene glycol and  
polyethylene glycol. If desired, such liquid preparations may contain colouring agents,  
15 flavouring agents, preservatives, saccharine and carboxymethyl cellulose or other  
thickening agents. Liquid preparations may also be prepared in the form of a dry powder to  
be reconstituted with a suitable solvent prior to use.

Solutions for parenteral administration may be prepared as a solution of a compound of the  
20 invention in a pharmaceutically acceptable solvent. These solutions may also contain  
stabilizing ingredients, preservatives and/or buffering ingredients. Solutions for parenteral  
administration may also be prepared as a dry preparation to be reconstituted with a suitable  
solvent before use.

25 The typical daily dose of the active substance varies within a wide range and will depend  
on various factors such as for example the individual requirement of each patient, the route  
of administration and the disease. In general, oral and parenteral dosages will be in the  
range of 0.1 to 1000 mg per day of active substance.

*Medical and pharmaceutical use*

The compounds of the invention are inhibitors of carboxypeptidase U either as such or, in the case of prodrugs, after administration. The compounds of the invention are thus  
5 expected to be useful in those conditions where inhibition of carboxypeptidase U is beneficial, such as in the treatment or prophylaxis of thrombosis and hypercoagulability in blood and tissues of mammals, including man.

It is known that hypercoagulability may lead to thrombo-embolic diseases. Conditions  
10 associated with hypercoagulability and thrombo-embolic diseases which may be mentioned include protein C resistance and inherited or acquired deficiencies in antithrombin III, protein C, protein S and heparin cofactor II. Other conditions known to be associated with hyper-coagulability and thrombo-embolic disease include circulatory and septic shock, circulating antiphospholipid antibodies, homocysteinemia, heparin induced  
15 thrombocytopenia and defects in fibrinolysis. The compounds of the invention are thus indicated both in the therapeutic and/or prophylactic treatment of these conditions. The compounds of the invention are further indicated in the treatment of conditions where there is an undesirable excess of proCPU/CPU.

20 Particular disease states which may be mentioned include the therapeutic and /or prophylactic treatment of venous thrombosis and pulmonary embolism, arterial thrombosis (e.g. in myocardial infarction, unstable angina, thrombosis-based stroke and peripheral arterial thrombosis) and systemic embolism usually from the atrium during arterial fibrillation or from the left ventricle after transmural myocardial infarction.

25 Moreover, the compounds of the invention are expected to have utility in prophylaxis of re-occlusion and restenosis (*i.e.* thrombosis) after thrombolysis, percutaneous trans-luminal angioplasty (PTA) and coronary bypass operations; the prevention of re-thrombosis after microsurgery and vascular surgery in general.

30 Further indications include the therapeutic and/or prophylactic treatment of disseminated intravascular coagulation caused by bacteria, multiple trauma, intoxication or any other

mechanism, fibrinolytic treatment when blood is in contact with foreign surfaces in the body, such as vascular grafts, vascular stents, vascular catheters, mechanical and biological prosthetic valves or any other medical device, and fibrinolytic treatment when blood is in contact with medical devices outside the body, such as during cardiovascular surgery using  
5 a heart-lung machine or in haemodialysis.

The compounds of the invention may also be combined and/or coadministered with any antithrombotic agent with a different mechanism of action, such as the antiplatelet agents acetylsalicylic acid ticlopidine, clopidogrel, thromboxane receptor and/or synthetase  
10 inhibitors, fibrinogen receptor antagonists, prostacyclin mimetics and phosphodiesterase inhibitors and ADP-receptor ( $P_2T$ ) antagonists and thrombin inhibitors.

The compounds of the invention may further be combined and/or coadministered with thrombolytics such as tissue plasminogen activator (natural, recombinant or modified),  
15 streptokinase, urokinase, prourokinase, anisoylated plasminogen-streptokinase activator complex (APSAC), animal salivary gland plasminogen activators, and the like, in the treatment of thrombotic diseases, in particular myocardial infarction and stroke.

20 CH<sub>2</sub>Cl<sub>2</sub> (70 mL) was added to 4-methoxytrityl chloride resin (7 g, L=0.91 mmol/g, 6.37 mmol) under argon and the resin was allowed to swell for 10 min and 2-amino-3-mercaptopropionic acid ethyl ester HCl-salt (5.9 g, 32 mmol) was added. TFA (70 mL) was then added in small portions over 10 min. The slurry was shaken at room temperature for 1 h and concentrated under reduced pressure. When almost dry, toluene (150 mL) was  
25 added and the mixture was again concentrated under reduced pressure. This procedure was repeated twice. The now yellow resin was washed with DMF (3x60 mL), CH<sub>2</sub>Cl<sub>2</sub> (2x60 mL), TEA:CH<sub>2</sub>Cl<sub>2</sub> (1:1, 2x60 mL), CH<sub>2</sub>Cl<sub>2</sub> (2x60 mL), MeOH (2x60 mL) and dried under vacuum overnight.

To calculate the loading of 2-amino-3-mercaptopropionic acid ethyl ester on the resin, 50  
30 mg of the product was treated with 10% TFA in CH<sub>2</sub>Cl<sub>2</sub> for 1 minute, and this procedure was repeated 4 times. The mixture was concentrated under reduced pressure to give 2-

Amino-3-mercapto-propionic acid ethyl ester (9.8 mg), indicating a loading of about 0.6 mmol/g.

- A solution of piperidine-1,4-dicarboxylic acid mono-*tert*-butyl ester (28 mg, 0.12 mmol) in  
5 DMF (1 mL) was added to the resin (100 mg, L=0.6 mmol/g, 0.06 mmol) in a plastic syringe, followed by PyBOP (62 mg, 0.12 mmol) in DMF (0.5 mL) and DIPEA (41  $\mu$ L, 0.24 mmol). The reaction was left at room temperature for 2 h with occasional stirring and the procedure was repeated once more. The resin was then washed with DMF (2x2 mL), CH<sub>2</sub>Cl<sub>2</sub> (2x2 mL), MeOH (2x2 mL), CH<sub>2</sub>Cl<sub>2</sub> (2x2 mL) and THF (2x2 mL).  
10 THF (800  $\mu$ L) was added to the syringe and the resin was allowed to swell for 10 min. Then water (250  $\mu$ L) and 10 M NaOH (50  $\mu$ L) were added. The reaction was left at room temperature for 16 h with occasional stirring. The resin was then washed with THF:water (1:1, 2x2 mL), THF (2x2 mL), CH<sub>2</sub>Cl<sub>2</sub> (2x2 mL), MeOH (2x2 mL) and CH<sub>2</sub>Cl<sub>2</sub> (2x2 mL).  
15 10 % TFA in CH<sub>2</sub>Cl<sub>2</sub> (1 mL) was added to the syringe and after 5 min the solution was collected in a tared vial. This procedure was repeated one more time and the combined organic phases were concentrated under reduced pressure to yield the title compound as the TFA salt (15.3 mg, 74 %).

### Example 33

#### 3-(6-Amino-pyridin-3-yl)-2-mercaptomethyl-hexanoic acid

##### (a) N-(5-Butyryl-pyridin-2-yl)-2,2-dimethyl-propionamide

A solution of N-(5-bromopyridin-2-yl)-2,2-dimethyl-propionamide (3.582 g, 13.9 mmol) in diethyl ether (36 mL) was cooled to  $-78^\circ\text{C}$  under argon and n-butyllithium (1.6 M, 19 mL, 30.4 mmol) was added dropwise within 20 min. 5 min after complete addition the mixture was allowed to warm up to  $0^\circ\text{C}$ . N-Methoxy-N-methyl butyramide (3.65 g, 27.8 mmol) was added within less than 5 min and stirring was continued for 45 min. The clear solution was acidified with 2 N hydrochloric acid to pH 2. After vigorous stirring for 15 min the mixture was neutralised with sodium hydrogen carbonate and the layers were separated. The aqueous layer was extracted three times with diethyl ether. The combined organic layers were washed with brine, dried and concentrated under reduced pressure. The resulting oil was dried in oil pump vacuum to remove the excess reagent. After flash chromatography (dichloromethane / methanol 60:1) crude N-(5-butyryl-pyridin-2-yl)-2,2-dimethyl-propionamide (2.47 g, 71%) was obtained as a light orange oil which was not purified further.

##### (b) N-[5-(1-Hydroxy-butyl)-pyridin-2-yl]-2,2-dimethyl-propionamide

Box I	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
<p>This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:</p> <ol style="list-style-type: none"> <li> <input checked="" type="checkbox"/> Claims Nos.: 16-17  because they relate to subject matter not required to be searched by this Authority, namely:  A method for treatment fo the human or animal body by therapy,  see rule 39.1 </li> <li> <input checked="" type="checkbox"/> Claims Nos.: 1-4 , 6-15  because they relate to parts of the international application that do not comply with the prescribed requirements to such  an extent that no meaningful international search can be carried out, specifically:  see next sheet </li> <li> <input type="checkbox"/> Claims Nos.:  because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).: </li> </ol>	
Box II	Observations where unity of invention is lacking (Continuation of item 2 of first sheet)
<p>This International Searching Authority found multiple inventions in this international application, as follows:</p> <ol style="list-style-type: none"> <li> <input type="checkbox"/> As all required additional search fees were timely paid by the applicant, this international search report covers all  searchable claims. </li> <li> <input type="checkbox"/> As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  of any additional fee. </li> <li> <input type="checkbox"/> As only some of the required additional search fees were timely paid by the applicant, this international search report  covers only those claims for which fees were paid, specifically claims Nos.: </li> <li> <input type="checkbox"/> No required additional search fees were timely paid by the applicant. Consequently, this international search report is  restricted to the invention first mentioned in the claims; it is covered by claims Nos.: </li> </ol> <p>Remark on Protest</p> <div style="display: flex; justify-content: space-between;"> <input type="checkbox"/> The additional search fees were accompanied by the applicant's protest. <input type="checkbox"/> No protest accompanied the payment of additional search fees. </div>	

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/SE00/00834

The present claims 1-4 and 6-15 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. No special search effort can be made for searching unduly wide and speculative claims (PCT Search Guidelines C-III 3.7).

Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely claim 5.

The applicants attention is drawn to the fact that claims relating to inventions in which no international search report has been established will not be the subject of an international preliminary examination (Rule 66.1(e) PCT). This is the case irrespective of whether or not the claims are amended following receipt of the search report during any Chapter II procedure.
